### Description

The VIP Sensors Model 1023A is a back-to-back comparison calibration accelerometer used for performing comparison calibrations of other accelerometers. The frequency response range (to 6 KHz) makes it very useful for calibrating a broad range of test accelerometers. The accelerometer is a self-generating device that requires no external power source for operation.

The Model 1023A design is a stainless steel construction that is epoxy sealed against external contamination. Signal ground is connected to the outer case of the unit. When used with an isolated mounting stud, the accelerometer is electrically isolated from ground. The accelerometer features a 10-32 side connector that is used with low-noise coaxial cable for error-free operation.

VIP Sensors Signal Conditioner Models 5002 and 5005 are recommended for use with this high impedance accelerometer.
